Sea-surface temperature anomalies (in degrees Celsius) in the equatorial Pacific during a strong El Niño event (1997–1998) show how temperatures vary from the long-term average temperature. The anomalies are based on a 7-day average around September 17, 1997. The bar beneath the map shows the temperature differences for the 7-day interval compared to long-term averages. Green and blues represent colder water temperatures than average and yellows through reds to browns represent warmer water temperatures than average. COURTESY OF THE US NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION (NOAA), CLIMATE PREDICTION CENTER/NECP/NWS.

Concentrations of atmospheric carbon dioxide for the years 1960 to 2010 at Mauna Loa in Hawaii. The blue line shows the long-term trend; the red line reflects this trend also, but in addition shows shorter-term annual variations. The insert shows the variability in concentrations of atmospheric carbon dioxide during a single year. IMAGE CREATED BY ROBERT ROHDE FROM DATA PUBLISHED BY THE US NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION (NOAA).
