William Logan in his laboratory in Montréal. REPRODUCED WITH THE PERMISSION OF
NATURAL RESOURCES CANADA 2013, COURTESY OF THE GEOLOGICAL SURVEY OF
CANADA.

All photographic and graphic images (henceforth referred to as images) posted on this site
are copyright of the persons and/or institutions indicated in the caption directly associated
with each image. The copyright holders have agreed that you may use their images for
educational, non-commercial purposes only and provided that they are credited in each
instance of use. For all other uses you must contact the copyright holder.
Tilted late Carboniferous rocks are exposed in the cliffs and on the beach at Coal Mine Point, Joggins, Nova Scotia. Note the coal seam extending from bottom right. ROB FENSOME.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
General extent of Silurian (A), Devonian (B), Carboniferous (C), and Permian (D) rocks at the surface (beneath glacial deposits), onshore and offshore. The lighter shaded areas denote either uncertainty or areas where rocks of the particular age have been confirmed but are intimately associated with rocks of other ages and the scale of the map doesn’t allow us to show them separately. ADAPTED FROM WHEELER ET AL. (1996).

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Paleogeography of what was to become North America and adjacent regions in the Silurian, 420 million years ago. Land is shown in brown, with shading showing topography. The lighter blue areas represent possible coastal or nearshore areas, darker blue represents deeper ocean waters, and black indicates trenches. Aspects of modern geography are shown for orientation.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Global paleogeography 420 million years ago, during the Silurian. Colours as for previous figure.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Colonies of the Silurian coral *Favosites* in strata at Quinn Point, near Jacquet River, New Brunswick. ROB FENSOME.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
The relationships of the various Appalachian terranes and seaways with Laurentia during part of the early Silurian (A); and with Euramerica during the late Silurian to early Devonian (B), the middle to late Devonian (C), and the early Carboniferous (D). The white lines indicate sea level.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Sugarloaf Mountain near Campbellton, New Brunswick, is an eroded volcanic plug, reflecting magmatic activity in Ganderia during the early Devonian. ROB FENSOME.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
These late Ordovician to early Silurian muddy limestone beds are exposed in the gorge of
the Saint John River at Grand Falls, New Brunswick. The original sediments were deposited
in a sedimentary basin on former Ganderia, and were deformed between about 440 and
390 million years ago, during the Salinic and Acadian orogenies. ROB FENSOME.

All photographic and graphic images (henceforth referred to as images) posted on this site
are copyright of the persons and/or institutions indicated in the caption directly associated
with each image. The copyright holders have agreed that you may use their images for
educational, non-commercial purposes only and provided that they are credited in each
instance of use. For all other uses you must contact the copyright holder.
Ediacaran strata deposited on Avalonia and tilted during the Acadian Orogeny, St. John’s, Newfoundland. KEITH VAUGHAN.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Life in a sheltered Silurian lagoon about 420 million years ago. Shallow, warm embayments were havens for eurypterids (sea scorpions), swimming predators up to 2 metres long and among the largest arthropods known. Their segmented bodies were usually streamlined and tapered to a tail end variably developed into a narrow spike or broad leaf-like structure. Their jointed limbs, which bore spines, pincers, and paddles, were attached beneath the head shield. Also shown are several small shrimp-like crustaceans, swimming across the path of the eurypterids, and a cluster of snails grazing among clumps of green algae on the seabed. PAINTING COPYRIGHT MARIANNE COLLINS, ARTIST.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
By the middle Devonian, large areas of the Appalachian Orogen were land and washed by rivers that left redbeds as their legacy, as here west of Miguasha, on Quebec’s Gaspé Peninsula. MIKE MELCHIN.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
At the top is a geological map of the Michigan Basin and adjacent areas showing the ages of the rocks exposed at the surface (after glacial deposits have been removed) and the course of the Niagara Escarpment. Below is a section across the basin from west of Lake Michigan to the Canadian Shield as shown by the line from A to B in the map. ADAPTED FROM DOYLE AND STEEL (2003).

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Looking out through the entrance of a cave cut in Silurian carbonate of the Niagara Escarpment. This cave faces Georgian Bay at Halfway Rock Point, Bruce Peninsula National Park of Canada, Ontario. D. A. WILKES, COPYRIGHT PARKS CANADA.

A Devonian underwater scene based on fossil fish found at Miguasha National Park in Quebec. Swimming toward the surface, to the right of centre and above the grass-like plants, is *Scaumenacia*, a member of the group of lobe-fins called lungfish. Dominating the scene and in the process of finishing a snack, *Eusthenopteron* is circling in search of additional prey. *Eusthenopteron* is also a lobe-fin but belongs to the group that gave rise to the tetrapods. Hugging the estuary bottom to the right and relatively small is the jawless *Escuminaspis*, and above it the much larger *Plourdosteus*, a voracious carnivore with jaws.

FROM CLOUTIER (2001), USED WITH PERMISSION; PAINTING BY FRANÇOIS MIVILLE-DESCHÊNES.

Potash ore from Devonian subsurface deposits in Saskatchewan. The ore, an evaporite rock called sylvinite, consists of a mixture of halite, sylvite (potassium chloride), carnallite (a complex mineral that includes potassium, chlorine, and magnesium), and other minerals. Sylvite is the principal ore mineral and source of potash. The red colour reflects iron oxide staining. DAN KOHLRUSS, SASKATCHEWAN GEOLOGICAL SURVEY.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Reefs and other important features on the Western Platform and adjacent areas during the late Devonian. The locations of the reefs now found in the Rocky Mountains Foothills and mountains are shown on this map in their probable original locations before Paleozoic rocks were thrust eastward during the Mesozoic (Chapter 9). ADAPTED BY KEN POTMA FROM WEISENBERGER AND POTMA (2001).

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. A. The late Devonian to Permian sedimentary basins and sub-basins of Atlantic Canada and surrounding areas. The highlands include: 1, Gaspé Highlands; 2, Miramichi Highlands; 3, Cape Breton Highlands; and 4, Western Newfoundland Highlands. B. Detail of the western Gulf of St. Lawrence and surrounding areas. ADAPTED FROM VARIOUS SOURCES.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Gypsum cliffs along the St. Croix River, near Windsor, Nova Scotia. The gypsum was deposited in the early Carboniferous Windsor Sea. WAYNE GARLAND.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
An early Carboniferous underwater lake scene. Three types of early ray-finned fish are shown: silvery purple *Rhadinichthys* swimming in a school toward the left; three larger, brownish-grey *Elonichthys* on the left; and a deep-bodied form akin to *Eurynotus* at right. In the background, coloured green, is the large lobe-finned fish *Latvius*. The colours are guesses, but the morphology is based on fossil finds from rocks at Albert Mines, New Brunswick. PAINTING BY JUDI PENNANEN, COURTESY OF THE NEW BRUNSWICK MUSEUM.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. Paleogeography of what was to become the Canadian Arctic in the middle Carboniferous to Permian, 325 to 285 million years ago. The approximate locations of Holman, Resolute, Grise Fiord, and Eureka are included to provide a guide for orientation, as well as paleolatitudes. The focus for the region, now approaching mid-latitudes, was the Sverdrup Seaway, a broad rift basin in which shallow-water deposits, including evaporites, accumulated. The arrows show the direction of crustal tension. Kimberlite pipes, the source of diamond deposits, are discussed in Chapter 12.

Late Carboniferous fluvial conglomerate and sandstone form the “flowerpot” sea stacks at Hopewell Cape, New Brunswick. The powerful Bay of Fundy tides undercut the rocks to form the unusual shapes. KEITH VAUGHAN.

All photographic and graphic images (henceforth referred to as images) posted on this site are copyright of the persons and/or institutions indicated in the caption directly associated with each image. The copyright holders have agreed that you may use their images for educational, non-commercial purposes only and provided that they are credited in each instance of use. For all other uses you must contact the copyright holder.
Deposits and environments associated with cycloths in the late Carboniferous. A depicts a river cutting into older sediments and depositing sand and gravel in its channel. The horsetail *Calamites* is growing along the banks, beyond which is a flood plain supporting a forest of clubmoss (*Sigillaria*) trees and ferns. Organic debris from the forest is building up a layer of peat that may eventually form coal. B shows the river overflowing its banks during a flood. Sand is deposited by the flood waters, choking the forest, covering the peat, and filling the old channel. Only the stumps of the trees are preserved, protected by the new layer of flood-deposited sand. In C, a new river channel is established and a new forest is growing on the flood plain. Periodically this cycle is broken by more general aquatic flooding, as shown in D, with possibly brackish waters marginal to a sea whose level rose because of melting ice in distant former Protopondwana; during this aquatic phase, thin, dark limestones full of bivalves (so-called clam coals, not shown) were sometimes deposited. Through time, this process builds up repeating layers of peat, sand, silt, clay, and limestone to produce the cycloths. ADAPTED FROM ATLANTIC GEOSCIENCE SOCIETY (2001).
